PROFILE

Engineering graduate who owns a production, multi-turn LLM system solo since May 2026: prompt design, retrieval, output guardrails and a custom evaluation harness built specifically to catch regressions before they ship, not after. I've already lived the exact failure mode this role is hired to fix: a prompt change improving one case while silently breaking another, caught by running the eval suite before release rather than by a client complaint. I use Claude Code daily, treat its output with the same scrutiny I'd apply to anyone else's code, and I work without anyone managing the day-to-day, which is the "high agency" this role asks for, not a line on a CV.

EXPERIENCE

Product Builder and Developer, Magical Chart

Independent project. Built and in production since May 2026. magicalchart.com

- Own a conversational, multi-turn AI assistant in production built on Anthropic's Claude: prompt design, structured and lexical retrieval, and output guardrails, the same model family and task shape as this role's base prompt.
- Built a custom evaluation harness that runs before every release against a 50-case bilingual benchmark with explicit pass/fail criteria, catching regressions before they reach a user, not after: zero call failures, 100% output-confidentiality compliance in production logs.
- Built a deterministic, pre-LLM safety filter for crisis-language detection (French, English, Spanish): for a rule that must never fail even once, the AI is never given the chance to decide, the system returns a fixed, pre-written response with real crisis-line numbers before the model is called at all.
- Scoped and shipped a multi-step AI agent using Anthropic tool-calling (not a single-shot wrapper): an isolated page, a daily usage quota, and a hard monthly spend cap read from usage logs before every call: deliberately contained, validating demand before committing budget.
- Built and published an open-source MCP (Model Context Protocol) server exposing the product's own engine as callable tools for any AI agent, verified with a real client handshake before release: direct experience building the kind of interface other systems call into, relevant to rolling updates across many client bots without breaking client-specific behaviour.
- Audited AI inference spend with a custom usage-tracking script, found one model choice responsible for 81% of cost on lower token volume, and migrated every production AI call to a more cost-efficient model without degrading output quality, the same "fewer regressions, measured results" discipline this role is scored on.
- Diagnosed and fixed a Stripe webhook defect that was silently blocking paying customers from access they had already bought: traced the request across services to the real cause instead of patching the symptom.
- Use Claude Code daily across scoping, building, testing and debugging, with judgment on when to trust its output and when to override it.

Independent Digital Consultant, florynepierson.com

Freelance, since 2024, France, remote. Portfolio: florynepierson.com/portfolio

- Built a Make.com automation for a client that removed a manual email triage step from their operations, plus some hands-on use of n8n for workflow automation: direct experience with two of the tools listed as a bonus for this role.
- Deliver SEO and analytics work for small-business clients end to end, from technical audit to implementation and measurement (Google Search Console, GA4, Microsoft Clarity).

Business Data Analyst, LOBELLIA Conseil, client mission at URSSAF

September 2024 to July 2025, France

Produced reporting and data-driven analyses; worked with business and technical stakeholders to clarify requirements, using SQL and PostgreSQL in a large-scale environment.

Business Data Analyst Intern, LOBELLIA Conseil

February to August 2024, France

Built Power BI dashboards and automated recurring reporting with VBA.

Data Science and AI Intern, Viaticum

May to August 2023, France

Designed and led an AI-based personalisation approach for travel offers end to end: problem definition, data analysis, solution development and stakeholder presentation.

EDUCATION

Engineering Degree (5-year), Data and Artificial Intelligence
ESILV, France, 2021 to 2024.

Exchange semester, Department of Computer Science
Hanyang University, South Korea, 2023.

SKILLS

Prompt engineering and AI quality: Production prompt design for multi-turn conversational systems, retrieval (structured and lexical), output guardrails, building evaluation/regression-test harnesses with explicit pass/fail criteria, multi-step tool-calling agents (Anthropic), the Model Context Protocol (built and published a server)

AI-assisted development: Daily, heavy use of Claude Code across scoping, building, testing and debugging; also used Codex and Cursor

Engineering: TypeScript, JavaScript, Node.js, SQL, PostgreSQL/Supabase, REST APIs, webhooks, Git, Vercel

Workflow automation: Make.com, n8n, Stripe integration, scheduled/cron jobs

LANGUAGES

French: native. English: fluent, C1 (TOEFL ITP 600/677). Spanish: intermediate.
